What is combination DMARD therapy?

This leaflet is a guide to help you understand the current treatments for early rheumatoid arthritis.

Two or more of these drugs are used together (combination therapy) to reduce pain, swelling and stiffness in your joints.

Combination therapy has been shown to produce the best long term outcome for rheumatoid arthritis.

The four drugs commonly used are Methotrexate, Hydroxychloroquine, Sulfasalazine and Leflunomide.

Your starting dose regime and combination will be decided by your doctor. During the early stages of treatment, most patients will also need corticosteroids by injection into muscle or joints or by tablets.

---

**Hydroxychloroquine**

This is a **daily** medication.

<table>
<thead>
<tr>
<th>Week 1 to 6</th>
<th>Morning</th>
<th>Evening</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><img src="200mg" alt="Hydroxychloroquine" title="one tablet" /></td>
<td><img src="200mg" alt="Hydroxychloroquine" title="one tablet" /></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Week 7 onwards</th>
<th>Morning</th>
<th>Evening</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><img src="200mg" alt="Hydroxychloroquine" title="one tablet" /></td>
<td></td>
</tr>
</tbody>
</table>

Continue on Hydroxychloroquine 200mg until your next appointment.

---

**Methotrexate**

This is a **once-a-week** medication.

<table>
<thead>
<tr>
<th>Weekly</th>
<th>Methotrexate Day</th>
<th>Folic acid Day</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Methotrexate 15 mg (6 tablets)</td>
<td>Folic acid 10 mg (2 tablets)</td>
</tr>
</tbody>
</table>

Continue Methotrexate 15mg and Folic Acid 10mg until your next appointment. Make sure you have a blood test during week 4.

---

It may take 3-4 months before you feel better

You will need a blood test every month

The dose may need to be increased during your clinic visits.

We only use the 2.5mg tablets to avoid confusion and allow flexibility in treatment dosage

---

It may take 3-4 months before you feel better

Please ensure you have an eye test annually with your optician.
Sulphasalazine

This is a daily medication.

<table>
<thead>
<tr>
<th>Morning (with food)</th>
<th>Evening (with food)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sulphasalazine EN 500mg (one tablet)</td>
<td>Sulphasalazine EN 500mg (one tablet)</td>
</tr>
<tr>
<td>Sulphasalazine EN 1000mg (two tablets)</td>
<td>Sulphasalazine EN 500mg (one tablet)</td>
</tr>
<tr>
<td>Sulphasalazine EN 1000mg (two tablets)</td>
<td>Sulphasalazine EN 500mg (one tablet)</td>
</tr>
</tbody>
</table>

Continue on Sulphasalazine 500mg or 1000mg twice a day until your next appointment. Make sure you have a blood test during week 4.

Leflunomide

This is a daily medication.

Continue on Leflunomide 20mg until your next appointment. Make sure you have a blood test during week 4.

It may take 3-4 months before you feel better.

You will need a blood test every month.

Please make sure that you are prescribed the “EN” tablets.

It may take 4-6 weeks before you start to feel better.

You will need a blood test and blood pressure check every month.

You may notice loose motions with this tablet. This often settles within a couple of weeks.
