## Acne Prescribing Guidelines - Clinical Management in Primary Care

### Clinical Management in Primary Care

- Treatment is determined by severity of the acne and the extent to which it bothers the individual. The presence of scarring should prompt more intensive treatment.
- **SELF-CARE:** Encourage patients to buy their own benzoyl peroxide products over the counter where possible.  
  *(Note supply issues. Confirm availability with local pharmacy)*
- No treatment works quickly in acne. Warn patient it is likely to take 2-3 months to see initial improvement and up to 6 months to see the full benefit.

### General Prescribing Points

- **Avoid topical retinoids and tetracyclines in pregnancy or breastfeeding, avoid tetracyclines in children (up to age 12)**
- In pregnant patients, the recommended treatments are benzoyl peroxide +/- topical erythromycin.
- All retinoids (except adapalene) are unstable with benzoyl peroxide so apply separately if both are prescribed.
- **DO NOT USE MINOCYCLINE** to treat acne as it is associated with a greater risk of lupus erythematosus-like syndrome and sometimes causes irreversible pigmentation.
- Do not treat with systemic antibiotic and a different topical antibiotic as this significantly increases the risk of antibiotic resistance.

### Treatment Regimes to use after 1st-line self-care (minimal make-up, wash with mild soap, do not scrub):

<table>
<thead>
<tr>
<th>Mild Acne</th>
<th>Mild to Moderate Acne</th>
<th>Severe Acne</th>
<th>Very Severe Acne</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Typically limited to the face, Uninflamed lesions</td>
<td>• On the face and often mild truncal disease, Comedones present</td>
<td>• More extensive lesions or acne unresponsive to topical antibiotic</td>
<td>• Facial lesions and widespread truncal disease</td>
</tr>
<tr>
<td>• Benzoyl peroxide to be bought OTC</td>
<td>• Topical therapy recommended. May require additional systemic treatment</td>
<td>• Systemic treatments should be used, useful for truncal disease where topical application is difficult</td>
<td>• Nodules &amp; cysts present, signs of acne scarring developing</td>
</tr>
<tr>
<td><strong>TREATMENT: 2&lt;sup&gt;nd&lt;/sup&gt; line</strong></td>
<td><strong>TREATMENT: 3&lt;sup&gt;rd&lt;/sup&gt; line</strong></td>
<td><strong>TREATMENT: 4&lt;sup&gt;th&lt;/sup&gt; line</strong></td>
<td><strong>TREATMENT: Specialist</strong></td>
</tr>
<tr>
<td>Benzoyl peroxide (BPO)&lt;sup&gt;1&lt;/sup&gt;* is the cheapest option, it works more quickly and is as effective as topical retinoids&lt;sup&gt;2&lt;/sup&gt;</td>
<td>Topical benzoyl peroxide 2.5% and adapalene 0.1% (Epiduo&lt;sup&gt;4&lt;/sup&gt; gel) or separately OR</td>
<td>Systemic antibiotic therapy PLUS topical retinoid/BPO treatment as per “Mild to Moderate” Acne. Select one of the following oral antibiotics (do not use with a topical antibiotic):</td>
<td>Systemic isotretinoin is indicated as monotherapy and is only available from secondary care: REFER</td>
</tr>
<tr>
<td><strong>NOTE:</strong> Panoxyl Aquegel was discontinued (June 17). Start with 2.5% BPO ↑ strength and frequency gradually as necessary OR</td>
<td>Topical retinoid plus topical antibiotic e.g. Treclin&lt;sup&gt;5&lt;/sup&gt; (tretinoin 0.025% + clindamycin 1%) or Topical antibiotic plus topical benzoyl peroxide*(prescribe separately or as Duac&lt;sup&gt;6&lt;/sup&gt; (BPO 5% + clindamycin 1%). OR</td>
<td>Suggested dosage schedules (in increasing cost order):</td>
<td>Systemic: Specialist</td>
</tr>
<tr>
<td><strong>Topical Adapalene (Differin&lt;sup&gt;®&lt;/sup&gt;)</strong></td>
<td>Consider addition of oral antibiotic (see severe section) instead of a topical antibiotic</td>
<td>• Doxycycline capsules 100mg daily OR</td>
<td><strong>Acne</strong></td>
</tr>
<tr>
<td><strong>NOTE:</strong> Resistance is more likely with topical antibiotics and topical clindamycin can cause resistance to oral erythromycin. Only use topical clindamycin if retinoids/BPO aren't tolerated and the patient does not want to take an oral antibiotic (or has contra-indications).</td>
<td><strong>NOTES</strong></td>
<td>• Oxytetracycline tablets 500mg bd OR</td>
<td><strong>Severe Acne</strong></td>
</tr>
<tr>
<td><strong>NOTES</strong></td>
<td><strong>NOTES</strong></td>
<td>• Lymecycline capsules 408mg daily (more expensive)</td>
<td><strong>NOTES</strong></td>
</tr>
<tr>
<td><strong>Apply topical retinoid once weekly increasing gradually to od</strong></td>
<td><strong>Apply topical retinoid once weekly increasing gradually to od</strong></td>
<td><strong>Choice depends on side-effects and resistance, no data to distinguish between the antibiotics in terms of efficacy</strong></td>
<td><strong>NOTES</strong></td>
</tr>
<tr>
<td><strong>Rapid increase can lead to redness, soreness and excessive peeling</strong></td>
<td><strong>Rapid increase can lead to redness, soreness and excessive peeling</strong></td>
<td><strong>Always combine systemic antibiotic with topical anti-acne agents retinoids +/- BPO to reduce resistance and improve outcome</strong></td>
<td><strong>Indicated for more severe disease or where acne has proven resistant to systemic antibiotic therapy - especially where there are signs of acne scarring.</strong></td>
</tr>
<tr>
<td><strong>DURATION: 6-8 weeks then review</strong></td>
<td><strong>DURATION: 12 weeks then review</strong></td>
<td><strong>DURATION: The need for continued antibiotic treatment should be reviewed at 3 months due to risk of resistance</strong></td>
<td><strong>DURATION: At least 16 weeks</strong></td>
</tr>
<tr>
<td><strong>Topical erythromycin (Zinerty&lt;sup&gt;®&lt;/sup&gt;) is no longer included in this guidance due to increasing resistance with topical erythromycin</strong></td>
<td><strong>Topical erythromycin (Zinerty&lt;sup&gt;®&lt;/sup&gt;) is no longer included in this guidance due to increasing resistance with topical erythromycin</strong></td>
<td><strong>NOTES</strong></td>
<td><strong>NOTES</strong></td>
</tr>
<tr>
<td><strong>Increase freq. of topical retinoid gradually to every night</strong></td>
<td><strong>Increase freq. of topical retinoid gradually to every night</strong></td>
<td><strong>Always combine systemic antibiotic with topical anti-acne agents retinoids +/- BPO to reduce resistance and improve outcome</strong></td>
<td><strong>NOTES</strong></td>
</tr>
<tr>
<td><strong>Topical antibiotics should not be used in isolation; use in combination with retinoid or BPO</strong></td>
<td><strong>Topical antibiotics should not be used in isolation; use in combination with retinoid or BPO</strong></td>
<td><strong>DURATION: The need for continued antibiotic treatment should be reviewed at 3 months due to risk of resistance</strong></td>
<td><strong>INDICATIONS</strong></td>
</tr>
<tr>
<td><strong>DURATION: 12 weeks then review</strong></td>
<td><strong>DURATION: 12 weeks then review</strong></td>
<td><strong>DURATION: At least 16 weeks</strong></td>
<td><strong>INDICATIONS</strong></td>
</tr>
</tbody>
</table>

**Once a suitable regime has been determined, gradual stepping down of treatment (e.g. from systemic plus topical to just topical) can be indicated once full therapeutic effect has been achieved, to find the minimum necessary to maintain suitable improvement.**

Medicines Management Team, NHS Wiltshire CCG with Dr Deirdre Buckley, Consultant Dermatologist, RUH. Date: February 2018
Oral Contraceptives

• For female patients, combined oral contraceptives may be used in combination with topical treatments or systemic antibiotics.
• A Cochrane review confirmed the efficacy of combined oral contraceptives in treating inflammatory and non-inflammatory acne but found few differences in efficacy between the different types, including cyproterone acetate, which is often recommended.
• It is therefore not clear whether formulations containing cyproterone acetate (Dianette® which is licensed for severe acne) should be favoured, especially because this agent may increase the risk of venous thromboembolism. The risk of blood clots in the veins with these medicines is 1.5 to 2 times higher than for combined oral contraceptives (COCs) containing levonorgestrel and may be similar to the risk with contraceptives containing gestodene, desogestrel or drospirenone. See MHRA Drug Safety Update for further information (references below).
• If Dianette® is being used, the need to continue treatment should be evaluated periodically by the treating physician.
• Progestogen only contraceptives worsen acne. If no contraception is required, discuss pros and cons of hormonal treatment.
• Recommendations are that no additional contraceptive precautions are required when combined oral contraceptives are used with antibiotics that do not induce liver enzymes (e.g. Doxycycline), unless diarrhoea or vomiting occur. Please check individual Summary of Product Characteristics for the patient’s contraceptive and the chosen antibiotic for specific advice. These recommendations should be discussed with the patient.

Reasons for Specialist Care

• Severe nodulo-cystic acne
• Severe social or psychological problems secondary to acne
• Scarring
• Moderate acne that has failed to respond to treatment i.e. lack of any benefit from two courses of different oral antibiotics each lasting at least three months at suggested acne dosage as above or only partial benefit after 6 months
• Suspected underlying endocrinological cause for acne, e.g. polycystic ovary syndrome - Refer if necessary to endocrinologist
• Diagnostic difficulty
• Severe variant of acne such as acne fulminans - very rare severe inflammatory acne with fever, malaise and joint symptoms (very urgent referral)
